Description

Technical Field

[0001] The present invention relates to a novel indazole compound having an excellent inhibitory action on protein phosphatase (protein kinase), especially on JNK protein kinase.

Prior Art

[0002] A cascade by action of mitogen-activated protein kinase (hereinafter referred to as "MAPK") is universally presents from yeasts to humans and plays a very important role as one of intracellular signaling pathways. Among such MAPK-related kinases in mammalian cells, three types of kinases, namely, extracellular signal-regulation kinase (ERK), p38, and c-Jun amino-terminal kinase (JNK; or also referred to as stress-activated protein kinases (SAPK)) are particularly well known. SAPKs have been found in rats and are JNK homologues, and it is known that isoform groups thereof each have an amino acid sequence 90% or more equivalent to that of a corresponding isoform group of JNKs (Nature, 369, 156, 1994). A multitude of activators relating to MAPK have been identified recently, and it has been clarified that pathways for activating ERK, p38, and JNKs play functionally different roles, respectively. Especially, the JNK system is considered to play a role as one of medically and pharmaceutically worthy intracellular signaling pathways for the following reasons. The JNK system is possibly an important signaling pathway that is activated by, for example, stress factors to cells, such as tumor necrosis factor α (TNF- α), interleukin-1 (IL-1), and other cytokines, as well as heat shock, ultraviolet rays (UV), and X-rays, and induces not only cell proliferation and/or differentiation but also apoptosis (cell death) (Science, 270, 1326, 1995). JNKs were first found as a kinase for phosphatasing orylating Ser 63 and Ser 73 at the N-terminus of c-Jun (Nature, 353, 670, 1991), but in recent, it has been clarified that JNKs phosphorylate many transcription factors such as ATF-2 and Elk-1 and regulate their activities (EMBOJ., 15, 2760, 1996). JNKs include three types, JNK 1, JNK 2 and JNK 3. JNK 1 and JNK 2 are expressed in most of tissues, but JNK 3 is particularly highly expressed in the brain (Neuron, 14, 67, 1995; Neuron, 22, 667, 1999). Analyses of knocked out mice lacking JNK 1 or JNK 2 have revealed that these JNKs play important roles in differentiation and/or activation of T cells (J. Exp. Med., 193, 317, 2001). In contrast, it has been reported that knocked out mice lacking JNK 3 have tolerance to spasticity initiated by kainic acid, an excitable amino acid receptor agonist, and that the knocked out mice lacking JNK 3 do not show apoptosis, which apoptosis is found in hippocampus nerve cells of normal mice after such spasticity (nature 389, 865, 1997). Death of nerve cells due to apoptosis is speculated to play an important role in nerve degeneration processes in neurodegenerative diseases such as Alzheimer's disease and Parkinson's disease (Experimental Neurology 133, 225, 1995; J. Neurol. Sci. 137, 120, 1996), and results indicating the possibility that JNKs are involved in the nerve cell death have been accumulated (Neuron, 14, 67, 1995; J. Neurochem., 76, 435, 2001).

[0003] For example, the following reports have been made on low-molecular substances having JNK inhibitory action.

(1) Compounds represented by the formula having antiinflammatory action, and compounds represented by the formula (1^{1a}) as specific embodiments thereof (WO 00/00491).

(2) 4-Aryloxyindole compounds represented by the formula (I²), and compounds represented by the formula (I^{2a}) as specific embodiments thereof (WO 00/35909).

(3) 4,5-Pyrazinoxyindole compounds represented by the formula (I³), and compounds represented by the formula (I^{3a}) as specific embodiments thereof (WO 00/35921).

(4) Compounds represented by the formula (I⁴), and compounds represented by the formula (I^{4a}) as specific embodiments thereof (WO 00/64872).

(5) Oxyindole derivatives represented by the formula (I⁵), and compounds represented by the formula (I^{5a}) as specific embodiments thereof (WO 00/35906).

(I⁸)(I^{8a})

(9) Sulfonamide derivatives represented by the formula (I⁹), and compounds represented by any of the formulae (I^{9a}), (I^{9b}) and (I^{9c}) as specific embodiments thereof (WO 01/23378, WO 01/23379, and WO 01/23382).

(I⁹)(I^{9a})(I^{9b})(I^{9c})

(10) Compounds represented by the formula (I¹⁰) having JNK inhibitory action, and compounds represented by the formula (I^{10a}) as specific embodiments thereof (EP 01/110957).

(I¹⁰)(I^{10a})

[0004] In contrast, reports have been made on compounds each having an indazole skeleton in, for example, JP-A 2000-501105, JP-A 2000-198734 and WO 99/23077. However, relations of all these compounds with protein kinases are neither disclosed nor indicated.

[0005] As is described above, the JNK system receives attention as one of important mechanisms relating to activation of various cells, regulation of immunocytes, or apoptosis of neurons induced by various stress signals. Accordingly, compounds exhibiting inhibitory action on the JNK pathway, particularly on JNK protein kinases are expected to be useful as therapeutic agents for various immunologic diseases, inflammatory diseases, and/or neurodegenerative diseases. However, compounds having excellent JNK protein kinase inhibitory action and satisfying requirements in, for example, pharmacological activities, dosage, and safety as pharmaceutical drugs have not yet been found.

Production Process 1

[0064]

[0065] The compound (I) can be produced by treating the fluorobenzene 1 with, for example, an alkyl lithium or lithium amide to thereby yield a metal aryl, allowing the metal aryl to react with an arylaldehyde to thereby yield the alcohol 2, oxidizing the alcohol 2 into the ketone 3, and then closing the indazole ring with hydrazine. The alkyl lithium for converting the fluorobenzene 1 to the metal aryl includes, for example, *n*-butyllithium, *sec*-butyllithium, *tert*-butyllithium, and phenyllithium. Where necessary, an additive such as N,N,N',N'-tetramethylethylenediamine and hexamethylphosphoramide can be added. The lithium amide includes, for example, lithium diisopropylamide, and lithium 2,2,6,6-tetramethylpiperide. Solvents for use herein are not specifically limited, as long as they are inert to the reaction, and preferred examples thereof are ether solvents such as diethyl ether, tetrahydrofuran, dioxane or dimethoxyethane, as well as benzene and toluene. A reaction temperature is from -78°C to room temperature. Oxidizing agents for oxidizing the alcohol compound 2 include, for example, manganese dioxide, sulfur trioxide-pyridine complex, N-methylmorpholine-N-oxide, and chromic acid oxidizing agents. The oxidation can also be performed by Swern oxidation or Moffat oxidation. Solvents for use herein can be any solvents that are not involved in the reaction and include, for example, halogenated hydrocarbons such as dichloromethane or chloroform, as well as ethyl acetate, acetonitrile, dimethyl sulfoxide, and dimethylformamide. A reaction temperature is generally from -78°C to the reflux temperature of the solvent. The reaction for cyclization of the compound 3 with hydrazine monohydrate can be performed in the absence of, or in the presence of, a solvent. Solvents for use herein are not specifically limited, as long as they are inert to the reaction, and include, for example, ether solvents such as diethyl ether, tetrahydrofuran, dioxane or dimethoxyethane, alcohol solvents such as methanol, ethanol or propanol, as well as pyridine, dimethyl sulfoxide, benzene, and toluene. The amount of the hydrazine monohydrate is from 2 to 20 equivalents to the raw material. A reaction temperature is generally from 0°C to the reflux temperature of the solvent.

Production Process 2

[0066]

[0067] The compound 2 can also be produced by Production Process 2. Initially, the fluorobenzene 1 is converted into a metal aryl by the procedure of Production Process 1, and the metal aryl is allowed to react with a formylation agent to yield the compound 4. Reaction solvents for use herein are not specifically limited, as long as they are inert to the reaction, and include, for example, ether solvents such as diethyl ether, tetrahydrofuran, dioxane or dimethoxyethane, as well as benzene and toluene. A reaction temperature is from -78°C to room temperature.

Production Process 3

[0068]

[0069] The compound (I) can also be produced by halogenating the 3-position of the indazole compound 5 to yield the compound 6, protecting the 1-position of the compound 6 to yield the compound 7, subjecting the compound 7 to Suzuki coupling with an arylboronic acid to yield the compound 8, and deprotecting the 1-position of the compound 8. Each reaction mixture was treated with 1.5 ml of a 0.5 M solution of 2-(di-*tert*-butylphosphino)biphenyl in *N*-methylpyrrolidone,

1.8 ml of a 8 M aqueous solution of potassium fluoride, and a catalytic amount of palladium(II) acetate by heating at 80°C for 12 hours. After removing the solution, the resin was washed according to the above procedure and was dried under reduced pressure. The resin was heated in 150 ml of a 2 M solution of stannic chloride in N-methylpyrrolidone at 80°C for 4 hours. After removing the solution, the resin was washed according to the above procedure and was dried in vacuo.

[0312] The resin was further divided among 12 groups (each 8 pieces) according to its label and was added to 15 ml of a solution of 0.5 M carboxylic acid in N-methylpyrrolidone of twelve types previously prepared, respectively. To each well were sequentially added 1.15 g of 1-hydroxybenzotriazole monohydrate, 1.2 ml of 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide (= WSC) and 2.0 ml of diisopropylethylamine. In a sulfonamide compound, a sulfonyl chloride reagent and diisopropylethylamine were added in tetrahydrofuran. The mixture was subjected to sonication for 1 hour and was left stand at room temperature for one day. After removing the solution, the resin was washed according to the above procedure and was dried under reduced pressure. The resin was placed in each of 96-well pin plate according to its label.

[0313] A mixture solution of 0.5 ml of trifluoroacetic acid, 0.1 ml of triisopropylsilane, and 0.5 ml of dichloromethane previously prepared was added to the resin in each of the 96-well plate, and the mixture was subjected to sonication for 10 minutes and was left stand for 30 minutes. This procedure was repeated twice, and the resin was washed with 1 ml of dimethylformamide. Next, nitrogen gas was blown to the acid-treated wells, and each residue was dissolved in a dimethylformamide solution obtained in washing procedure, was purified and separated by LC-MS (developing solvent (eluent); 0.1% solution of trifluoroacetic acid in acetonitrile:0.1% aqueous solution of trifluoroacetic acid = 1: 99 to 100:0/20 minute-cycle, flow rate; 20 ml/min, column; YMC Combiprep ODS-AM, 20 mmΦ x 50 mm (Long)), to give the following compounds.

[0387] The compounds according to Examples I-101 to I-107 were synthesized by the following Synthesis Process I-B.

Synthesis Process I-B

[0388] The resin was subjected to the procedures of Synthesis Process I-A till the treatment with stannic chloride and was divided among two groups (each 48 pieces) according to the label, followed by amidation with a 0.5 M solution of any of two amino acids having an amino group protected by Fmoc group in N-methylpyrrolidone. Each of the resin was washed and was treated with N-methylpyrrolidone solution containing 20% piperidine to thereby remove the Fmoc group.

[0389] The resulting resin was divided among twelve groups (each 8 pieces), ten groups of which were treated with any of 0.5 M solution of five alkyl bromides in N-methylpyrrolidone and cesium carbonate for alkylation of the amide group. Then, the resin was subjected to an acid treatment according to the procedure of Synthesis Process I-A, was separated and purified by LC-MS according to the procedure of Synthesis Process I-A, to give the following compounds.

[0397] The compounds according to Examples I-108 to I-156 were synthesized by the following Synthesis Process I-C.

Synthesis Process I-C

[0398] A solution of 180 mg of each indazolecarboxylic acid produced in Production Examples I-1 to I-25 in 8 ml dimethylformamide was pipetted into several test tubes in an amount of 0.5 ml each, each of which was treated with 1.1 equivalents of any of various amines. The reaction mixture was sequentially treated with 0.065 ml of a 1 M solution of 1-hydroxybenzotriazole monohydrate in dimethylformamide, 0.130 ml of a 1 M solution of 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide (=WSC) in dimethylformamide, and 0.05 ml of diisopropylamine, the mixture was subjected to sonication for 10 minutes and was left stand for one day. Each of the reaction mixtures was separated and purified by LC-MS under the conditions of Synthesis Process I-A and thereby yielded the test compounds.

[0853] A total of 25.6 mg of C-{3-(3-fluoro-phenyl)-6-methoxy-1*H*-indazol-5-yl}-methylamine obtained in Production Example 26 was dissolved in 1.9 ml of dimethylformamide, 15.3 mg of 1=hydroxybenzotriazole, 0.066 ml of diisopropylethylamine and 14.4 mg of 3-methoxybenzoic acid were added thereto, and 27.2 mg of 1-ethyl-3-(3'-dimethylaminopropyl)carbodiimide hydrochloride (i.e., WSC.HCl) was added thereto under ice-cooling and stirring. After stirring at room temperature for 5 hours, water was added and the mixture was extracted with ethyl acetate. The resulting organic layer was washed with 0.5 N aqueous sodium hydroxide solution, 1 N hydrochloric acid and saturated brine, dried over magnesium sulfate, and the solvent was evaporated. The residue was purified and separated by silica gel column chromatography (dichloromethane:methanol=10:1), to give 9.24 mg of the title compound as pale yellow crystals.

¹H-NMR (400MHz, CD₃OD) δ 3.83 (3H, s), 3.98 (3H, s), 4.66 (2H, s), 7.03 (1H, s), 7.07-7.14 (2H, m), 7.34-7.43 (3H, m), 7.47 (1H, dt, J = 6.0, 8.0 Hz), 7.59-7.64 (1H, m), 7.72 (1H, d, J = 8.0 Hz), 7.89 (1H, s).

[0980] The compounds (I) according to the present invention or a salt thereof exhibited an excellent action in tests for determining JNK inhibitory action. For example, the inhibitory actions on JNK 3 were as follows.

TEST EXAMPLE 1 Determination of JNK 3 Inhibition

[0981] Human JNK 3 was expressed as a fusion protein (GST-JNK 3) with glutathione S-transferase (GST) in *Escherichia coli* and was purified using glutathione Sepharose 4B beads. The amino acid sequence 1-169 of c-Jun was peppered as a fusion protein (GST-c-Jun) with GST in *Escherichia coli*, was purified using glutathione Sepharose 4B beads and was used as a substrate. A test compound was diluted with 100% dimethyl sulfoxide into 10 mM and was then further diluted with 10% aqueous dimethyl sulfoxide solution to yield a dilution series. To each well of 96-well OPTI plate (available from Packard) were placed 20 μ l of the diluted compound, 30 μ l of a substrate solution (1.2 μ g of GST-c-Jun, 0.04 μ g of GST-JNK 3, 0.2 μ Ci of (γ -³²P)ATP, 25 mM of HEPES pH=7.5, 10 mM of magnesium acetate, and 3.33 μ M of ATP), and 50 μ l of an enzyme solution (0.04 μ g of GST-JNK 3, 25 mM of HEPES pH=7.5, and 10 mM magnesium acetate) up to 100 μ l, and the mixture was allowed to react for 30 minutes. After terminating the reaction by adding 100 μ l of a reaction terminator (80 mM ATP, 50 mg/ml glutathione SPA beads (available from Amersham Pharmacia Biotech)), the reaction mixture was shaken for 30 minutes. The mixture was centrifuged at room temperature at 1000 \times *g* for 5 minutes, and the emission intensity thereof was determined on a TopCount™ illuminator (available from Packard). The activity is expressed by the 50% inhibitory concentration on the enzymatic activity of JNK, i.e., IC₅₀ (nM).

Results: The compounds (I) according to the present invention or a salt thereof showed an excellent JNK 3-inhibitory activity. Examples of IC₅₀ thereof will be shown below.

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

- 1.
- ☒
- Claims Nos.: 31, 34-36

because they relate to subject matter not required to be searched by this Authority, namely:

Claims 34-36 pertain to a method for treatment of the human body by therapy. The subject matter of claim 31 and the use thereof are no more than a method for treatment of the human body by therapy. (Article 17(2)(a)(i) of the PCT; Rule 39.1(iv) of the Regulations under the PCT)

- 2.
- ☐
- Claims Nos.:

because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

- 3.
- ☐
- Claims Nos.:

because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

(See extra sheet)

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.☐ No protest accompanied the payment of additional search fees.

Continuation of Box No.II of continuation of first sheet(1)

The subject matters of claims 1-24 pertain to compounds represented by the formula (I). The formula (I) involves an extremely large number of compounds because substituents are shown alternatively. The only technical feature common to the compounds is a 1H-indazole structure substituted in the 3-position with an aromatic cyclic hydrocarbon group or aromatic heterocyclic group.

However, compounds represented by the formula (I) are known to be useful for the treatment of various diseases (see, e.g., JP 4-247079 A and JP 2000-501105 A). It cannot hence be said, on the basis of that structure, that those compounds and the process for producing the compounds are so linked as to form a single general inventive concept.

The subject matters of claims 25-30, 32, and 33 pertain to a medicinal composition containing any of the compounds as the active ingredient. However, functions of these also are described in the documents cited above. Consequently, the same applies to these claims.

Therefore, the subject matters shown above do not comply with the requirement of the unity of invention.

With Respect to Scope of Field in Which Search was Made

Although the compounds of this invention are represented by the formula (I) given in claim 1, the formula involves an extremely large number of compounds. However, the compounds which are disclosed in the meaning of Article 5 of the PCT and are supported by the description in the meaning of Article 6 of the PCT are limited to an extremely small part of those compounds.

Consequently, a search was made with respect to only the part which is specifically disclosed in and supported by the description, i.e., the 1H-indazole structure which has been substituted in the 3-position with an aromatic cyclic hydrocarbon group or aromatic heterocyclic group and in the 5-position with an optionally substituted atom other than hydrogen.
